## High Performance Computing and Big Data: Challenges for the Future

Jack Dongarra University of Tennessee Oak Ridge National Laboratory University of Manchester

9/9/19

- Overview of High Performance Computing
- Look at issues on convergence of HPC and Big Data
- Killer app for HPC, BD, and Machine Learning.

H. Meuer, H. Simon, E. Strohmaier, & JD

- Listing of the 500 most powerful Computers in the World
- Yardstick: Rmax from LINPACK MPP

Ax = b, dense problem

Updated twice a year
 SC'xy in the States in November
 Meeting in Germany in June

- All data available from www.top500.org

# State of Supercomputing in 2019

- Pflops (> 10<sup>15</sup> Flop/s) computing fully established with all 500 systems.
- Three technology architecture possibilities or "swim lanes" are thriving.
  - Commodity (e.g. Intel)
  - Commodity + accelerator (e.g. GPUs) (133 systems)
  - Special purpose lightweight cores (e.g. IBM BG, Knights Landing, TaihuLight, ARM (only 1 system))
- Interest in supercomputing is now worldwide, and growing in many new markets (~50% of Top500 computers are in industry).
- Intel processors largest share, 96% followed by AMD, .6%.
- Exascale (10<sup>18</sup> Flop/s) projects exist in many countries and regions.

### June 2019: The TOP 10 Systems (1/3 of the Total Performance)

Ç

_	Rank	Site	Computer	Country	Cores	Rmax [Pflops]	% of Peak	Power [MW]	GFlops/ Watt

### Performance Development of HPC over the Last 26 Years from the Top500

### **COUNTRIES SHARE**

In terms of performance: US has 38% China has 30% Japan has 7.5%

## **Performance Distribution**

Tpeak<sub>50</sub> = 3.944 Pflop/s

8 9/9/19

 $Tpeak_{500} = 1.022 Pflop/s$ 

54% of the total performance of Top500 in Top50

9

### Current #1 System Overview

#### System Performance

- Peak performance of 200 Pflop/s for modeling & simulation
- Peak performance of 3.3 Eflop/s for 16 bit floating point used in for data analytics, ML, and artificial intelligence

#### Each node has

- 2 IBM POWER9 processors
  - Each w/22 cores
  - 2.3% performance of system
- 6 NVIDIA Tesla V100 GPUs
  - Each w/80 SMs
  - 97.7% performance of system
- 608 GB of fast memory
- 1.6 TB of NVMe memory

#### The system includes

- 4608 nodes
  - 27,648 GPUs
  - Street value \$15K each
- Dual-rail Mellanox EDR InfiniBand network
- 250 PB IBM Spectrum Scale file system transferring data at 2.5 TB/s

### US Department of Energy Exascale Computing Program has formulated a holistic approach that uses co-design and integration to achieve capable exascale

### Department of Energy (DOE) Roadmap to Exascale Systems

An impressive, productive lineup of accelerated node systems supporting DOE's mission

#### hpcg-benchmark.org

### HPCG Results; The Other Benchmark

- High Performance Conjugate Gradients (HPCG).
- Solves Ax=b, A large, sparse, b known, x computed.
- An optimized implementation of PCG contains essential computational and communication patterns that are prevalent in a variety of methods for discretization and numerical solution of PDEs
- Patterns:
  - Dense and sparse computations.
  - Dense and sparse collectives.
  - Multi-scale execution of kernels via MG (truncated) V cycle.
  - Data-driven parallelism (unstructured sparse triangular solves).
- Strong verification (via spectral properties of PCG).

### Scientific Computing is Changing

- In the past, we moved experimental data to the centralized servers, which provided bulk storage and computational resources for analysis and simulation.
- Three things have changed:
  - CPU advances have enabled edge/IoT devices to be small parallel computers with real operating systems and multithreaded programming models (CUDA, OpenMP, TensorFlow, etc.).
  - Machine learning and AI has helped create a new class of algorithms that can sift through massive amounts of experimental data, and then pushing to the data center only the relevant results
  - Edge devices and scientific instruments are rapidly expanding, creating a new class of "edge software defined instrument" that must connect to cyberinfrastructure.

- These three changes are forcing us to rethink the central services model of HPC and embrace a new model where network infrastructure computes-along-the-way.
- To realize that goal, we need a new conceptual model for programming this new endto-end infrastructure.

- Edge data is too large to collect and transmit.
- Need lightweight learning at the edge: sorting, searching, learning about the distribution.
- Edge data is pulled into the cloud to learn
- Inference model is sent back to the edge.

- Machine learning in the application.
  - for enhanced scientific discovery
- Machine learning in the computational infrastructure.
  - for improved performance
- Machine learning at the edge.
  - for managing data volume

### Today many precisions to deal with (IEEE Standard)

Туре	Size	Range	$u = 2^{-t}$
half	16 bits	10 <sup>±5</sup>	$2^{-11}\approx 4.9\times 10^{-4}$
single double	32 bits 64 bits	10 <sup>±38</sup> 10 <sup>±308</sup>	$2^{-24} pprox 6.0  imes 10^{-8}$ $2^{-53} pprox 1.1  imes 10^{-16}$
quadruple	128 bits	10 <sup>±4932</sup>	$2^{-113}\approx9.6\times10^{-35}$

 Note the number range with half precision (16 bit fl.pt.)
 Sign exponent (8 bits)
 IEEE SP fraction (10 bits)

- Four Performance levels for the different precision
  - 64 bit floating point (FMA): 7.5 Tflop/s
  - 32 bit floating point (FMA): 15 Tflop/s
  - 16 bit floating point (FMA): 30 Tflop/s
  - 16 bit floating point with Tensor core: 120 Tflop/s
    - Numerical characteristics of arithmetic on Tensor core different

Tensor Core Performance from: Mixed Precision Matrix Multiply 4x4 Matrices

Also supports FP16 accumulator mode for inferencing

#### Study of the Matrix Matrix multiplication kernel on Nvidia V100

#### Study of the Matrix Matrix multiplication kernel on Nvidia V100

dgemm achieve about 6.4 Tflop/s sgemm achieve about 14 Tflop/s hgemm achieve about 27 Tflop/s Tensor cores gemm reach about 85 Tflop/s

#### Matrix matrix multiplication GEMM

#### Study of the Matrix Matrix multiplication kernel on Nvidia V100

dgemm achieve about 6.4 Tflop/s sgemm achieve about 14 Tflop/s hgemm achieve about 27 Tflop/s Tensor cores gemm reach about 85 Tflop/s

#### Matrix matrix multiplication GEMM

#### Study of the rank k update used by the LU factorization algorithm on Nvidia V100

For s = 0, nb, .. N

- 1. panel factorize
- 2. update trailing matrix

LU factorization requires O(n<sup>3</sup>) most of the operations are spent in GEMM

### Leveraging Half Precision in HPC on V100 solving linear system Ax = b

#### For s = 0, nb, .. N

- 1. panel factorize
- 2. update trailing matrix

	TRSM
Panel	GEMM

- Panel Factorization performed with 32 bit fl pt
  - Done using MAGMA on the front-end system
- TRSM Triangular solve performed with 32 bit fl pt
  - Done using V100 (no Tensor core)
- GEMM Matrix Multiply performed with 16 bit fl pt
  - Done on V100 with Tensor cores

Most of the performance comes from GEMM using 16 bit fl pt

### **Use Mixed Precision algorithms**

➤Achieve higher performance

→ faster time to solution

Reduce power consumption by decreasing the execution time

→ Energy Savings !!!

> Need the original matrix to compute residual (r) and matrix cannot be too badly conditioned

### Leveraging Half Precision in HPC on V100 Performance Behavior

Flops =  $2n^3/(3 \text{ time})$ meaning twice higher is twice faster

- solving Ax = b using FP64 LU
- solving Ax = b using FP32 LU and iterative refinement to achieve FP64 accuracy
- solving Ax = b using FP16 LU and iterative refinement to achieve FP64 accuracy
- solving Ax = b using FP16 Tensor Cores LU and iterative refinement to achieve FP64 accuracy

Problem generated with an arithmetic distribution of the singular values  $\sigma_i = 1 - (\frac{i-1}{n-1})(1 - \frac{1}{cond})$  and positive eigenvalues.

### **Improving Solution**

• z is the correction or  $(x_{i+1} - x_i)$ 

Xi

 Computed in lower precision and then added to the approximate solution in higher precision  $x_i + z$ 

 $X_{i+1}$ 

Iterative refinement for dense systems, Ax = b, can work this way.

### **Recent Results Run at Scale...**

- Mixed precision iterative refinement approach solved a matrix of order 10,091,520 on ORNL's Summit system.
  - Composed of nodes made up of 2 IBM Power-9 processors (22 cores each) plus 6 Nvidia V100 GPUs (84 SMs each)
  - The run used 4500 nodes of Summit, 2,466,000 cores = 4500\*(22\*2 + 84\*6)
  - Used a random matrix with large diagonal elements to insure convergence of the method.
- Mixed precision HPL achieved 445 PFLOPS or 2.95X over DP precision HPL result on the Top500 (148 PFLOPS).
  - 43 Gflops/Watt
- Same accuracy compared to full 64 bit precision

### **Conclusion:**

- We accelerated the solution of linear system Ax = b solver using hardware-accelerated FP16 arithmetic on GPUs;
- We introduced a framework for exploiting mixed-precision FP16-FP32/FP64 iterative refinement solvers and describe the path to draw high-performance and energy-aware GPU implementations;
  - Ideas can be applied to other 1 sided reductions (LU, LL<sup>T</sup>, LDL<sup>T</sup>, QR) and also for 2 sided in the case of eigenvalue/vectors. Building this into the SLATE LA library (will replace LAPACK and ScaLAPACK, part of DOE-ECP).
- Our technique shows that a number of problems can be accelerated up to 4X by the usage of the FP16-TC or 2X using the FP32 arithmetic.
- > We have rigorous error analysis to support everything.
- Potentially provide an additional benchmarks for ML Supercomputers, looking at mixed precision performance.

## **Questions?**

- Am I guaranteed the stability, accuracy and convergence properties using lower precision?
  - Maybe, depends on the condition of the matrix, algorithm needs 1 digit of accuracy in the approximation, then will converge to full accuracy.
- What memory and performance improvements can I expect when using lower precision?
  - Cost is 1.25 times the memory, potential factor of 4 improvement in time to solution
- What implementation challenges exist for application and enabling technologies developers?
  - Can be put into applications now.
